Power for industry

#### Experience and innovation for industry

TWK srl, founded in 1996, plays a key role in the Italian and international market as a leader in the heat production and temperature control for the industry. Much of the company success is supported by the large number of products, which cover a wide range of thermal potential (6 to 5000 kW) , working fluids ( oil, water , steam and air ) and power supply systems (electric, gas, oil , secondary circuits ) , all made to satisfy every customer's requirements and expectations. We have developed built-in units, standard or special, specifically designed to be simple, safe, reliable, and applicable to a variety of industries; these devices are widely used in several sectors, from textile to woodworking , from plasticizing to chemical , from the mold industry to the food one.

Each project is studied in detail by TWK's engineers and technicians, who are able, with the help of the most modern graphics software, to reconcile product efficiency and reliability to an innovative design and more compact dimensions. The use of metal cutting and bending machines, combined with many years of experience in welding of steels and alloys, allows the company to adapt to the market needs, supplying the customer with countless bespoke solutions, as well as with a wide range of standardized products.

The strong market competitiveness, increasingly stringent standards in terms of safety, energy and environment and the expansion of commercial boundaries, pushed TWK srl to a continuous research in the waste reduction and energy efficiency, which are today our core values.
